TWENTY-THIRD REPORT

OF THE

BOARD OF SUPERINTENDENCE OF THE DUBLIN HOSPITALS.

TO HIS EXCELLENCY FRANÇOIS THOMAS EARL
COWPER, K.G.,

Lord Lieutenant-General and General Governor of Ireland,
dc., dc., dc.

6th September, 1881.

MAY IT PLEASE YOUR EXCELLENCY,

We, the Board of Superintendence of the City of Dublin Hospitals, have the honour to submit to your Excellency this our Twenty-third Annual Report and Statistical Returns for the year ended 31st March, 1881.

During the above period we have inspected the several Hospitals in this city which receive aid from Parliament.

These are :—

1. Westmorland Lock Hospital.
2. The House of Industry Hospitals, viz. :—
 - a. Hardwicke Fever Hospital.
 - b. Whitworth Medical Hospital.
 - c. Richmond Surgical Hospital.
3. Steevens's Hospital.
4. Meath Hospital and County Dublin Infirmary.
5. Cork-street Fever Hospital.
6. Rotunda Lying-in Hospital.
7. Coombe Lying-in Hospital.
8. St. Mark's Ophthalmic Hospital; and
9. Hospital for Incurables, which receives a portion of the Concordatum Fund.

On these occasions we carefully examined the wards and other parts of the buildings to observe their condition and the care and attention bestowed on the patients by the officers and servants.

We visited the culinary departments and examined the dietaries in use, and the manner of preparing the food, and ascertained that the arrangements for serving it in the wards were carried out with proper regard to the comforts of the patients. When making these inspections some of the Governors and medical and other officers accompanied us, and we inquired respecting such matters as might assist in enabling us to supervise these institutions, and report thereon "in accordance with provisions of the 18th section of the Dublin Hospitals Act."

During the past year 10,708 patients were admitted into the wards of these Hospitals, exclusive of 785 who remained therein on the 1st April, 1880, making a total of 11,493 cases treated as intern patients. Of this number, 10,428 left the wards cured, relieved, or were dismissed for other causes.

The mortality was 6·39 per cent. on the cases—estimated on the numbers who have been discharged, or who have died, or whose cases have consequently been treated to a termination.

Seven hundred and ninety-eight patients remained under treatment in the wards on the night of the 31st March in the present year.

The total daily average number of beds occupied in all the Hospitals throughout the year was 801·94.

The sojourn in Hospital of each patient, omitting the inmates of the Hospital for Incurables, averaged 20·4 days.

During the foregoing period* 35 patients suffering from alcoholic poisoning, or affected with delirium tremens, were under treatment in the above institutions.

In our three last Reports we have called the attention of the Hospital Boards to the inconveniences which attend the admission of patients labouring under delirium tremens, when no special or necessary means exist for their accommodation, or suitable apartments for their reception where the possibility of doing injury to themselves could be avoided.

To admit a delirious patient to a general ward is most prejudicial to the well-being of its other occupants, distracts the attention of the nurses from their ordinary duties, and imposes great responsibility on the medical attendant. We regret again to state that no adequate arrangements appear to have been made to meet this great evil, and we think the subject requires the special attention of the Hospital authorities.

In the Appendices annexed, are submitted a series of tabular statements, which show the statistics of each Hospital in respect to income and expenditure, the number of patients treated and the results, together with the average cost per bed occupied in each Hospital.

THE WESTMORLAND LOCK.

This institution appears to realize nearly all the conditions required for the successful treatment of the class of patients for whose use it is designed, but we believe that the spread of disease would be greatly checked if patients could be induced to enter the Hospital, or could be removed to it for treatment in the early stages of disease.

The wards on inspection presented a clean and orderly appearance, and the patients were well and properly attended. The sewerage, which is old and somewhat defective, runs partly under the Hospital. This we consider a faulty arrangement, as it is of the greatest importance that all drains, pipes, sinks, &c., should

* Since the above was in print we have received a Return showing that 26 additional patients suffering from Delirium Tremens had been treated in the wards of the Hardwicke Hospital during the year.

not only be carefully guarded with traps, but also should be so constructed as to be easily and completely examined without tearing up any part of the building.

The streets in the vicinity are for the most part narrow, crowded, and not properly cleaned; the situation is low. It is therefore the more necessary to devote particular attention to sanitary arrangements. Should the proposed new street leading through the locality to the Custom House Swivel-bridge be opened up, it would greatly tend to remove some of the nuisances complained of, and contribute much to the health of this institution.

Eight hundred and twenty-five patients were treated in the Hospital during the year, 12 died, giving a mortality of 1·57 per cent. on the total number, 762, treated to a termination.

Thirteen children were born in the institution during the year. The average daily number of beds occupied was 66·25, and the time spent in Hospital by each patient averaged 29·38 days.

We append some statistical tables carefully compiled from the Hospital books for the last four years (1877 to 1881), which in addition to other information discloses the fact that the number of patients admitted has largely increased during the last three years. This might probably be attributed to the augmentation of the military forces in this country during the above period.

STEEVENS'S HOSPITAL.

On the 1st March we carefully examined the several departments of this institution, and found the buildings in good order, many improvements having since our last inspection been carried out for promoting the well-being and comfort of the patients.

We found the kitchen imperfectly lighted, but the cooking utensils were clean, and the fuel appeared to be economically used.

With regard to the quality of the food supplied, and the cooking, we are able to report favourably. The patients' dinners were served in each ward in tin cases provided with an under compartment filled with boiling water, by which means the meat was kept hot. Potatoes are added to the full diet dinner instead of bread, as formerly, this change is highly appreciated by the patients.

On inspecting the epidemic wards, we found that the defective arrangements respecting the clothing of patients under treatment for infectious diseases still existed; these defects were so obvious that we considered it necessary merely to mention them in our twentieth and twenty-first Reports to insure immediate correction. On the 3rd March, 1881, the Chairman of the Board of Superintendence directed a communication to be addressed to the Governors of the Hospital in reference to this matter and also to the want of proper means for giving baths to convalescent patients. We have since been informed that the Governors have ordered the erection of an additional room to the Fever Hospital, with bath, presses, &c., where discharged patients can be thoroughly bathed, and can put on their own disinfected clothing previously

to leaving the Hospital; this we consider a most important and necessary precaution against the spread of contagion.

The laundry was well kept, but we were informed that the washing-machines which could economise labour were not used.

This Hospital could afford great advantages for the promotion of medical education, and it is to be regretted that the medical school formerly connected with it is not maintained as heretofore.

The interests of the patients and of the pupils are not in our opinion conflicting. By the attendance of a class of students, the internal working of an institution is to a certain degree made public, and subjected to severe criticism, greater facilities are afforded for selecting dressers and clinical clerks for the Hospital service, and the presence of the pupils stimulates the medical attendants to give more time and perhaps closer attention.

It has been stated by the authorities of the Hospital that they did not consider the school to be for the advantage of the institution or conducive to the due care of the patients, but the Board of Superintendence are of opinion that it is, to say the least, unfortunate, that a medical and surgical school which has existed for more than twenty-three years should be discontinued. The Board of Superintendence are not satisfied with the reasons adduced by the Governors for the suppression of this School of Anatomy, which was the only one in that quarter of the city available for students.

There were 105 patients in this institution at the commencement of the year; 1,484 were admitted; 1,400 discharged; 46 died, and 143 remained on the 31st March, 1881.

The mortality was 3.18 per cent. on the total number treated to a termination.

The time spent in Hospital by each patient averaged 28 days, and the average daily number of beds occupied during the year was 121.91.

MEATH HOSPITAL.

We found the wards clean and well ventilated, and observed that the patients were properly attended.

The Standing Committee are at present engaged in carrying out some of the suggestions made in our last report. The fever wards have been furnished throughout with bedsteads provided with wire woven mattresses, and in connexion with these wards, but external to the main building, a chamber is being erected in which all outgoing patients will dress after receiving a bath, and thus be able to leave without again going through the wards. A disinfecting chamber is to be constructed which is guaranteed to be capable of thoroughly destroying the germs of infection.

To carry out a suggestion in our last Report, glass bed urinals are about to be substituted for porcelain at present in use.

The Standing Committee have also employed an architect, to prepare plans for remodelling the lavatory and water closet system of the Hospital, arranging the latter so as to be external to the main building, and approached by properly ventilated corridors, and also to prepare a plan for removing the post-mortem room from its present objectionable position underneath the operating theatre to a contiguous building.

These improvements it is the earnest desire of the Governors to effect, and they hope they will be enabled, if not entirely to accomplish them during the current year, to do at least much towards their completion.

Ninety-two patients remained in Hospital on the 1st April, 1880; 1,271 were admitted during the year; 1,217 were discharged, and 58 died, giving a mortality of 4.44 per cent. on 1,305 cases treated to a termination.

The average daily number of beds occupied was 848.4.

The time spent in Hospital by each patient averaged 22.71 days.

CORK-STREET.

This Hospital on inspection was in a satisfactory condition in respect of cleanliness, ventilation, and other arrangements; its efficient maintenance is a great benefit not only to the class of patients for which it is designed, but in a special manner to the public at large, by isolating infectious cases and providing for fever patients necessary care and skilful attention.

During the past year a considerable sum has been expended on repairs and renovation of some portions of the institution, as well as on the establishment of two observation wards, male and female, where doubtful cases may be placed and treated until the true type of the disease unmistakably manifests itself. This provision has supplied what had been felt as a great want in the Hospital.

The Committee having had under consideration the scale of remuneration and the arrangements for providing the diet of nurses, decided, in order to secure the services of a better class of women, to raise their wages, and instead of an allowance in cash in lieu of rations to provide them with a substantial dinner at a regular hour; this has conduced to their well-being and efficiency, making them better fitted to resist the influence of infection.

The Managing Committee report that whatever success has attended their efforts in maintaining the character of the Hospital as a well managed institution, is largely due to the unremitting skill and attention of their Medical Staff, as well as to the constant care and intelligent supervision exercised by the Resident Medical Officers and Lady Superintendent, aided and supported by an efficient body of nurses.

On the 1st April, 1880, 80 patients remained in Hospital; 1,250 were admitted during the year ended 31st March last; 1,100 were discharged; 187 died; and 43 remained at that date.

The average daily number of patients in Hospital was 84, and the sojourn in Hospital of each patient averaged 23 days.

The mortality was 14.53 per cent. which appears moderate considering the nature of the cases under treatment, many of which were of a most dangerous character.

HOUSE OF INDUSTRY.

On inspection this institution was in a satisfactory condition, the wards were clean and airy, the changes of linen sufficient, and the bedding appeared to be good. We are of opinion, however, that the substitution of feather pillows for those at present

in use would be an improvement, and add much to the comforts of the patients.

The culinary department was in excellent order, the provisions of good quality, and the cooking satisfactory.

We have been informed that the Governors not having funds for the erection of a building wherein to isolate and treat delirium tremens patients, have decided to refuse admission to such patients, and have adopted the suggestion made in our twentieth Report, viz. :—"that these cases might be sent to the workhouse, or the Lunatic Asylum during the continuance of the delirium."

To admit patients suffering from delirium tremens to the Hardwicke Hospital and treat them as heretofore in the same wards with fever patients, was an arrangement prejudicial to the management of the institution.

The out-patients' department in the Richmond Hospital, recently provided, has been carefully planned, and appears to meet all necessary requirements.

In two former reports we called attention to the unfortunate arrangement, by which the post-mortem room of the Richmond Hospital is placed under the seats in the operating theatre, and we pointed out the great danger incurred by the patients and students. Our suggestions have not been adopted by the Governors, and we have again to express our opinion that no dead bodies should be allowed to remain in the apartment to which we have referred, and that a proper post-mortem room should be provided in a separate building. There is ample space in the post-mortem room of the Hardwicke Hospital for all such cases; and there is therefore the less excuse for the continuance of this objectionable arrangement.

HARDWICKE FEVER HOSPITAL.

On the 1st April, 1880, there remained in the hospital 48 patients; 998 were admitted, including 1 born in the institution during the year; 848 were discharged, and 158 died, giving a mortality of 15·70 per cent.

The average daily number of beds occupied throughout the year was 51·07; and the time spent in hospital by each patient averaged 17·82 days.

WHITWORTH HOSPITAL.

Fifty-six patients remained on the 1st April, 1880; 835 were admitted, including 2 born in the hospital, during the year; 761 were discharged, and 63 died in the year ended 31st March, 1881.

The average daily number of beds occupied through the year was 54·37, and the time spent in hospital by each patient averaged 22·28 days.

RICHMOND HOSPITAL.

Ninety-four patients remained on the 1st of April, 1880; 1,071 were admitted during the year; 1,037 discharged, and 35 died, giving a mortality of 3·26 per cent. on 1,072 surgical cases treated to a termination.

The average daily number of beds occupied throughout the year was 81·46 per cent., and the time spent in hospital by each patient averaged 25·22 days.

ROTUNDA.

We carefully examined the several departments of this institution, and found the wards and corridors scrupulously clean and well ventilated. The patients appeared to be carefully attended, and we were informed that the nurses and midwives wear dresses that can be, and are, frequently washed.

Considerable improvements, particularly as regards sanitary arrangements, have recently been carried out. A suitable chamber has been erected outside the Hospital building for the reception of the soiled linen, which is now carried direct there-to from the wards, and immediately placed in slate tanks, where it is during twelve hours subjected to a constant stream of cold water, before being transmitted to the laundry.

The hot air disinfecting chamber erected last year works very satisfactorily.

The Governors report, "that during the greater part of the year, the whole city was in a most unsanitary condition, as shown by the high death-rate, and that condition necessarily affected the patients admitted; numbers of these were found to be ill on admission, and as a result, the mortality was in excess of the average of late years; there was not, however, any epidemic, and since last February the admission of unhealthy patients has been markedly less, the result being a very small rate of mortality."

The number of admissions of unmarried women and of those who are utterly destitute, continues to be very large.

On the 1st April, 1880, there were 25 patients in the labour wards; 1,301 were admitted during the year; 1,046 were discharged after delivery; 229 were discharged, not having been delivered; 22 died; and 29 remained in the Hospital at the end of the year.

Twenty-seven patients remained in the Auxiliary or Chronic Department on the 1st of April, 1880; 528 were admitted; 512 were discharged; 25 died in the year ended 31st March, 1881 and 18 then remained.

The mortality of the labour patients, deducting the 229 non-parturient cases, was 2.06 per cent., and that of the chronic class was 4.65 per cent.

The average daily number of beds occupied throughout the year by labour patients was 25.76; by chronic cases 21.22.

The time spent in Hospital by labour cases was 7.09 days, and by the chronic class 13.95 days.

We find that during the year 16 of those patients who were transferred (from five to ten days after being confined in the labour wards) to the Auxiliary Department died there of diseases not ordinarily connected with parturition.

These deaths are not reckoned as belonging to the Lying-in Department.

On referring to the annexed classified list of diseases it appears that, 10 patients died during the year of septicæmia, a malady

which owes its existence to the same or similar germs of disease as erysipelas, pyæmia, or puerperal fever. As contagion spreads from such conditions with fatal results to other patients, and adheres with tenacity to everything with which it comes in contact, particularly to woollen articles, and is conveyed by the clothes and even by the hands of attendants, we recommend that when such a malady breaks out in Hospital the patient attacked should be promptly isolated, the other inmates of the ward removed, and the greatest care taken to prevent the attendants becoming the agents of disseminating disease.

The ward should be thoroughly disinfected and should remain unoccupied for a considerable time, exposed to air and sunlight.

During the prevalence of a zymotic epidemic lying-in cases should be attended as much as possible at their own homes.

COOMBE.

On inspection we found the wards and other parts of the Hospital clean and orderly; the patients were carefully attended.

The large and continuous increase of numbers seeking relief at the out-patients' department, testify how highly valued the institution is by those for whom it is intended.

We were glad to observe that a separate and detailed account is now accurately kept of all expenditure incurred on account of stimulants supplied to extern cases, an arrangement which provides a careful check on the consumption of such stores.

Three labour cases remained in Hospital on the 1st April, 1880; 499 were admitted during the year; 414 were discharged; 9 died; 11 remained at the close of the year.

Thirteen patients remained in the chronic wards on the 1st April, 1880; 117 were admitted; 117 discharged; 5 died, and 8 remained at the end of the year.

The mortality of patients admitted to the labour wards, deducting 68 that were discharged, not having been delivered, was 9 deaths in 423 cases, or 2.12 per cent.; that of the chronic class was 4.09 per cent.

INCURABLES.

This Hospital continues to be conducted with efficiency and economy, and on inspection presented its usual appearance of being kept in most creditable order; the patients receive every care and attention.

We found the ventilation of No. 10 ward rather defective. The Governors seemed, however, to be aware of the fact, and will probably take steps to remedy it.

At the commencement of the year 157 remained in the institution; 65 were admitted; 4 discharged; 47 died, and 171 remained on the 31st March, 1881.

The average daily number of beds occupied was 162, and the time spent in Hospital by each patient averaged 266.35 days.

ST. MARK'S.

The condition of this Hospital on inspection was satisfactory, and its reputation for efficiency continues to be maintained. We are informed by the Governors that a ward has been recently allotted for the reception and treatment of contagious ophthalmia and that patients suffering from this disease, hitherto refused admittance, are now received by the medical officers and treated by them with most gratifying results.

The dietary has been still further improved; the patients receiving at their dinner meal full meat diet of beef and mutton, with vegetables on four days of the week, soup on two days, and bread and gruel on the remaining day. The additional expense thereby entailed is considerable, but no increased charge has been made as regards constabulary, poor law or other pay patients.

On the 1st April, 1880, 32 patients were in Hospital; 517 were admitted during the year; 525 discharged, and 24 then remained.

The average daily number of beds occupied was 29.15, and the time spent in hospital by each patient averaged 19.38 days.

The registry of patients appears to be kept with great accuracy.
